Investigate a Dataset

August 5, 2022

Tip: Welcome to the Investigate a Dataset project! You will find tips in quoted sections like this to help organize your approach to your investigation. Once you complete this project, remove these **Tip** sections from your report before submission. First things first, you might want to double-click this Markdown cell and change the title so that it reflects your dataset and investigation.

1 Project: Investigate a Dataset - TMDb movie data

This data set contains information about 10,000 movies collected from The Movie Database (TMDb), including user ratings and revenue.

Certain columns, like 'cast' and 'genres', contain multiple values separated by pipe (|) characters. There are some odd characters in the 'cast' column. Don't worry about cleaning them. You can leave them as is. The final two columns ending with "_adj" show the budget and revenue of the associated movie in terms of 2010 dollars, accounting for inflation over time. ## Table of Contents

Introduction

Data Wrangling

Exploratory Data Analysis

Question 1 What is the mean film budget over the years?

Question 2 What is the mean film revenue over the years?

Question 3 What is the mean film gain over the years?

Question 4 What is the total year film gain over the years?

Question 5 What is the mean film gain over the years grouped by 5 years?

Question 6 What is the total year film gain over the years by group of 5 years?

Question 7 What is the mean film gain over the years grouped by 10 years?

Question 8 What is the best principal film genre overall time?

Question 9 What is the cast number for films overall time?

Question 10 What is the mean runtime evolution over the years?

Question 11 What is the runtime of biggest films over the years?

Question 12 What is the most popular actor overall time?

Question 13 What is the biggest production company (by number of produced films) overall time?

Question 14 Films directors by number of directed films overall time?

Question 15 Month associated with high revenue overall time?

Question 16 Film's genres mixture repartition overall time?

Question 17 Films directors with total film gain overall time?

Question 18 Film's genres with total gain overall time?

Question 19 The most rated film's genre overall time?

Question 20 What is the biggest production company (by total gain of produced films) overall time ?

Conclusions

Introduction

1.0.1 Dataset Description

Tip: In this section of the report, provide a brief introduction to the dataset you've selected/downloaded for analysis. Read through the description available on the homepage-links present here. List all column names in each table, and their significance. In case of multiple tables, describe the relationship between tables.

The Movie Database (TMDB) is a community built movie and TV database. Every piece of data has been added by our amazing community dating back to 2008. TMDb's strong international focus and breadth of data is largely unmatched and something we're incredibly proud of. Put simply, we live and breathe community and that's precisely what makes us different.

The TMDB Advantage

- 1 Every year since 2008, the number of contributions to our database has increased. With over 400,000 developers and companies using our platform, TMDB has become a premiere source for metadata.
- 2 Along with extensive metadata for movies, TV shows and people, we also offer one of the best selections of high resolution posters and fanart. On average, over 1,000 images are added every single day.
- 3 We're international. While we officially support 39 languages we also have extensive regional data. Every single day TMDB is used in over 180 countries.
- 4 Our community is second to none. Between our staff and community moderators, we're always here to help. We're passionate about making sure your experience on TMDB is nothing short of amazing.
- 5 Trusted platform. Every single day our service is used by millions of people while we process over 3 billion requests. We've proven for years that this is a service that can be trusted and relied on.

source

1.0.2 Question(s) for Analysis

Tip: Clearly state one or more questions that you plan on exploring over the course of the report. You will address these questions in the **data analysis** and **conclusion** sections. Try to build your report around the analysis of at least one dependent variable and three independent variables. If you're not sure what questions to ask, then make sure you familiarize yourself with the dataset, its variables and the dataset context for ideas of what to explore.

Tip: Once you start coding, use NumPy arrays, Pandas Series, and DataFrames where appropriate rather than Python lists and dictionaries. Also, **use good coding practices**, such as, define and use functions to avoid repetitive code. Use appropriate comments within the code cells, explanation in the mark-down cells, and meaningful variable names.

- 1) Research Question 1: What is the mean film budget over the years?
- 2) Research Question 2 What is the mean film revenue over the years?
- 3) Research Question 3 What is the mean film gain over the years?
- 4) Research Question 4 What is the total year film gain over the years?
- 5) Research Question 5 What is the mean film gain over the years grouped by 5 years?
- 6) Research Question 6 What is the total year film gain over the years by group of 5 years?
- 7) Research Question 7 What is the mean film gain over the years grouped by 10 years?
- 8) Research Question 8 What is the best principal film genre overall time?

```
[1]: # Use this cell to set up import statements for all of the packages that you # plan to use.

# Remember to include a 'magic word' so that your visualizations are plotted # inline with the notebook. See this page for more:

# http://ipython.readthedocs.io/en/stable/interactive/magics.html # loading packages import numpy as np import pandas as pd import seaborn as sns import matplotlib.pyplot as plt %matplotlib inline
```

```
[2]: # Upgrade pandas to use dataframe.explode() function.
# !pip install --upgrade pandas==0.25.0
```

Data Wrangling

Tip: In this section of the report, you will load in the data, check for cleanliness, and then trim and clean your dataset for analysis. Make sure that you document your data cleaning steps in mark-down cells precisely and justify your cleaning decisions.

1.0.3 General Properties

Tip: You should *not* perform too many operations in each cell. Create cells freely to explore your data. One option that you can take with this project is to do a lot of explorations in an initial notebook. These don't have to be organized, but make sure you use enough comments to understand the purpose of each code cell. Then, after you're done with your analysis, create a duplicate notebook where you will trim the excess and organize your steps so that you have a flowing, cohesive report.

```
[3]: # Load your data and print out a few lines. Perform operations to inspect data # types and look for instances of missing or possibly errant data.

df = pd.read_csv('./Database_TMDb_movie_data/tmdb-movies.csv')
```

1.0.4 Printing DataFrame's data type and dimensions

```
[4]: df.shape
[4]: (10866, 21)
```

The TMdb dataset contains 10866 rows and 21 columns.

```
[5]: df.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10866 entries, 0 to 10865
Data columns (total 21 columns):

[5 rows x 21 columns]

Here is presented the first 5 rows of the TMdb dataset, lets dive in.

The are Id and imdb_id columns corresponding to each film.

The film runtime runtime

The is popularity of the film

The film budget budget_adj and the film revenue revenue_adj adjusted to the inflation over time

The genres of the movie, the production_compagnies the release_date, the audience votes vote_count and the average vote vote_average.

1.0.6 Data Cleaning

Tip: Make sure that you keep your reader informed on the steps that you are taking in your investigation. Follow every code cell, or every set of related code cells, with a markdown cell to describe to the reader what was found in the preceding cell(s). Try to make it so that the reader can then understand what they will be seeing in the following cell(s).

In this part there are columns that are not valuable for our analysis such as id, imdb_id, homepage, tagline,keywords, overview, budgetand revenue.

We'll also identify and count rows with crucial missing values such as revenue_adj, budget_adj, cast and genres. Even though we could fill numeric columns with the mean(), how can we deal with missing cast or missing genres? We can't predict or fill them.

For the numeric values we will count and if there are minor we'll drop all of them. Otherwise We'll fill them with the mean().

```
[7]: # After discussing the structure of the data and any problems that need to be # cleaned, perform those cleaning steps in the second part of this section.
```

```
[8]: df.drop(['id', 'imdb_id', 'homepage', 'tagline','keywords', 'overview', □

→'budget', 'revenue'],

axis=1,

inplace=True)
```

Let's print the head of the new DataFrame.

```
[9]: df.head()
```

```

1.0.7 Descriptive Statistics

Let's describe basic statistics for each numeric column of our dataset.

[10]: df.describe()

[10]:		popularity	runtime	vote count	vote_average	release_year	\
	count	10866.000000	10866.000000	10866.000000	10866.000000	10866.000000	•
	mean	0.646441	102.070863	217.389748	5.974922	2001.322658	
	std	1.000185	31.381405	575.619058	0.935142	12.812941	
	min	0.000065	0.000000	10.000000	1.500000	1960.000000	
	25%	0.207583	90.000000	17.000000	5.400000	1995.000000	
	50%	0.383856	99.000000	38.000000	6.000000	2006.000000	
	75%	0.713817	111.000000	145.750000	6.600000	2011.000000	
	max	32.985763	900.000000	9767.000000	9.200000	2015.000000	
		budget_adj	revenue_adj				
	count	1.086600e+04	1.086600e+04				
	mean	1.755104e+07	5.136436e+07				
	std	3.430616e+07	1.446325e+08				
	min	0.000000e+00	0.000000e+00				

```
25% 0.000000e+00 0.000000e+00
50% 0.000000e+00 0.000000e+00
75% 2.085325e+07 3.369710e+07
max 4.250000e+08 2.827124e+09
```

As we can see, there are problems with some rows like runtime, budget_adj, revenue_adj where most values are missing or are Zeros. We'll count them all.

Let's look after all columns with at least one NaN value

[11]: ['cast', 'director', 'genres', 'production_companies']

Let's look after all columns with at least one Zeros value

```
[12]: col_with_zeros_value = [col for col in df.columns if (df[col]==0).any() ]
col_with_zeros_value
```

[12]: ['runtime', 'budget_adj', 'revenue_adj']

Let's count the Zeros values in runtime, budget_adj, revenue_adj columns.

```
[13]: (df['revenue_adj']==0).sum()
```

[13]: 6016

There are 6016 Zeros values in the revenue adj column. How Huge they are.

```
[14]: (df['budget_adj']==0).sum()
```

[14]: 5696

There are 5696 Zeros values in the budget_adj column. How Huge they are.

```
[15]: (df['runtime']==0).sum()
```

[15]: 31

There are 31 Zeros values in the runtime column.

We can't drop them, the number is so important.

We'll fill the zeros values per colum with the mean. Let's proceed.

Let's calculate and fill the zeros by the mean.

```
[16]: mean = {col: df[col].mean() for col in col_with_zeros_value}
#print(mean)
```

```
fill = [df[col].replace(to_replace=0, value=mean[col], inplace=True) for col in_u \hookrightarrow mean.keys()]
```

[17]: # Deleting unnecessary variables del col_with_nan_value, col_with_zeros_value, mean, fill

Let's look after the number of missing(NaN) values in our dataset

```
[18]: df.isnull().any(axis=1).sum()
```

[18]: 1093

```
[19]: 100 * df.isnull().any(axis=1).sum() / df.shape[0]
```

[19]: 10.058899318976625

There are 1095 rows with at least one missing value, representing 10.07% of our dataset.

```
[20]: 100 * (df.shape[0] - df.isnull().any(axis=1).sum()) / df.shape[0]
```

[20]: 89.94110068102337

The correct values of our dataset represent 89.92% of it. Though we have 10866 rows, we can drop all of the incorrect values.

```
[21]: df.dropna(inplace=True)
```

Let's look about duplicates in our dataset.

```
[22]: df.duplicated().sum()
```

[22]: 1

There is one duplicate in our dataset. We'll drop it.

```
[23]: df.drop_duplicates(inplace=True)
```

Now that we have cleaned our dataset, let's describe it again.

```
[24]: df.describe()
```

[24]:		popularity	runtime	vote_count	vote_average	release_year	\
	count	9772.000000	9772.000000	9772.000000	9772.000000	9772.000000

For further analysis, we will add new columns in our dataframe. - gain_adj the gain value (revenue_adj - budget_adj) for each film - release_month_name the month name of the release date - cast_num the number of cast members of the film - genres_num the number of genres mixtures of the film - year_by_5 group years by 5 of length. Ex: 1965[included]-1970[excluded], 1970[included]-1975[excluded] and so on - year_by_10 group years by 10 of length. Ex: 1965[included]-1975[excluded], 1975[included]-1985[excluded] and so on

```
[29]: df['gain_adj'] = df['revenue_adj'] - df['budget_adj']

memory usage: 1.5+ MB
```

We'll define a function extract() to extract elements from a pd.Series in rows that contain | and return a pd.DataFrame of all elements with their occurences

Steps: 1) We extract elements from the pd.Series object with the help of the function pd.Series.apply(lambda val: val.split("|")) 2) We create a list of all these elements 3) Now we'll create a dict object to count every element occurrence with the help of this source and we will sort to firstly have the most popular element, with the help of this source 4) After that we'll convert our dict objet to pd.DataFrame object with the help of this source

```
[39]: def extract(serie: pd.Series)-> pd.DataFrame:
          group_set = []
          for element in serie.apply(lambda val: val.split("|")) :
              #print(element)
              for subelt in element:
                  #print(subelt)
                  group_set.append(f'{subelt.strip()}')
          # Now we create an array of items
          group_set = np.array(group_set)
          # We create a dict object key: actor, value: number of appearances
          # Now we count every actor apparition in the `group_set`
          # variable with np.count_nonzero() and np.unique()
          dict_elts = {actor: np.count_nonzero(group_set == actor) for actor in np.

unique(group_set)}
          # We sort the dict with the most popular actor first (according
          # to the maximum number of appearances)
          dict_elts = dict(sorted(dict_elts.items(), key=lambda item: item[1],__
       →reverse=True))
          # After that we'll convert our `dict` objet to `pd.DataFrame` object
          df_elts = pd.DataFrame.from_dict(data=dict_elts, orient='index',__
       ⇔columns=['value'])
          # We return the pd.DataFrame object
          return df_elts
```

Exploratory Data Analysis

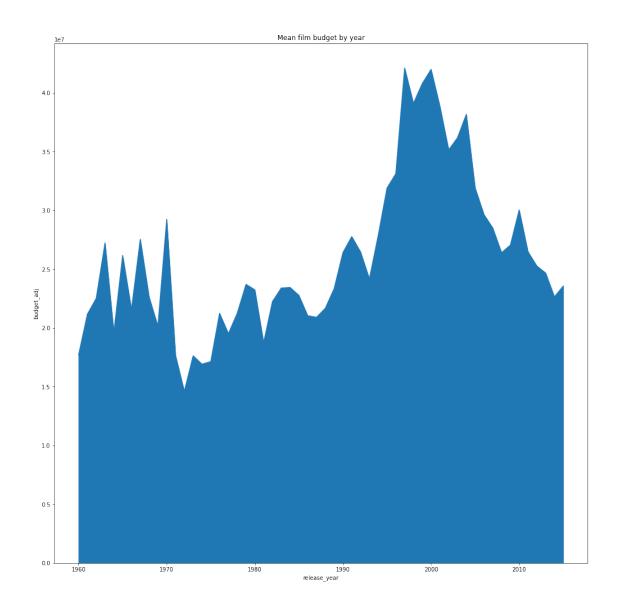

Tip: Now that you've trimmed and cleaned your data, you're ready to move on to ex-

ploration. Compute statistics and create visualizations with the goal of addressing the research questions that you posed in the Introduction section. You should compute the relevant statistics throughout the analysis when an inference is made about the data. Note that at least two or more kinds of plots should be created as part of the exploration, and you must compare and show trends in the varied visualizations.

Tip: - Investigate the stated question(s) from multiple angles. It is recommended that you be systematic with your approach. Look at one variable at a time, and then follow it up by looking at relationships between variables. You should explore at least three variables in relation to the primary question. This can be an exploratory relationship between three variables of interest, or looking at how two independent variables relate to a single dependent variable of interest. Lastly, you should perform both single-variable (1d) and multiple-variable (2d) explorations.

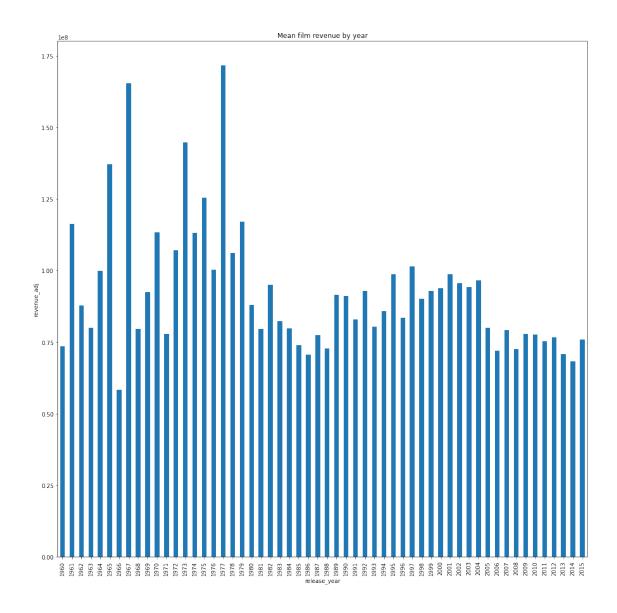

Research Question 1: What is the mean film budget over the years?

For that we will group our dataset by years and get the mean film budget for each year and plot.

As we can see, there has been an increasing films budgets in the early 2000's, why? Perhaps beacause of the vulgarisation of the films distribution means, Internet apparition, devices, communication possibilities, and so on...

Research Question 2 What is the mean film revenue over the years?

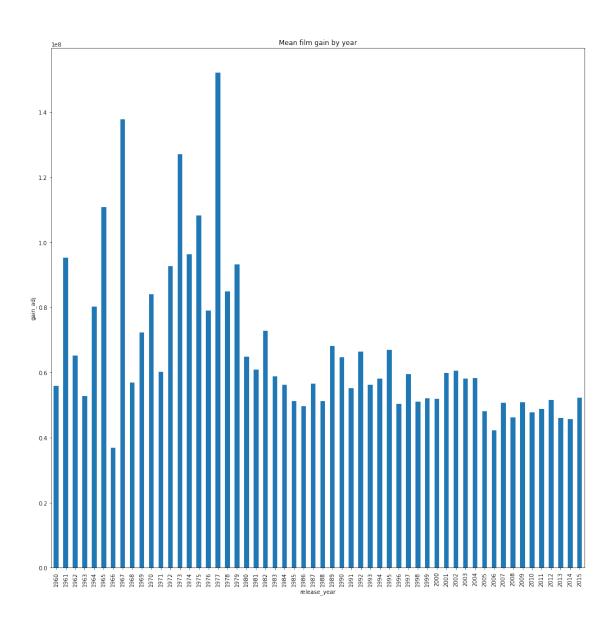

There were great revenues in 1967 and 1977. But the revenues are stable and greatly high overall time.

Research Question 3 What is the mean film gain over the years?

```
[42]: df.groupby('release_year').mean()['gain_adj'].plot(kind='bar', figsize=(17, 17), title='Mean film gain by

→year', ylabel='gain_adj');
```

```
[43]: df.groupby('release_year').mean()['gain_adj'].min()
```

[43]: 36913300.504791535

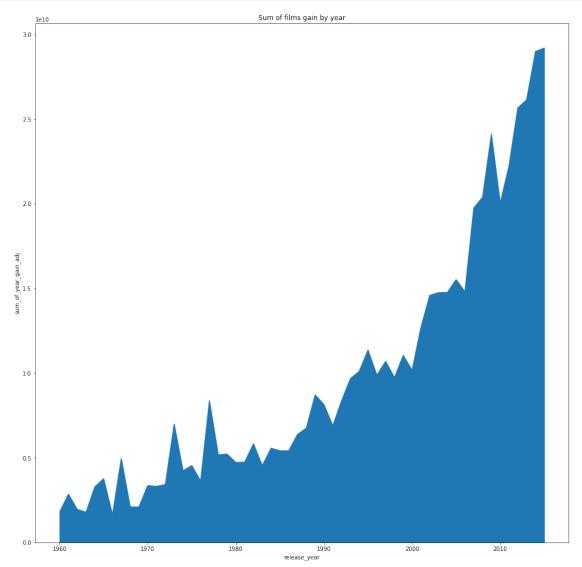

We can surely say that the film industry is a paying industry. The minimum mean gain overall time is around $40\ 000\ 000\ \$$.

Research Question 4 What is the total year film gain over the years?

```
[44]: df.groupby('release_year').sum()['gain_adj'].plot(kind='area', figsize=(17, 17), title='Sum of films gain by⊔ →year',
```

```
u

ylabel='sum_of_year_gain_adj');
```

We can say that the total year film gain evolution over the years is greatly increasing. Year 2014 is the year of biggest gain overall time, and year 2015 comes closer.

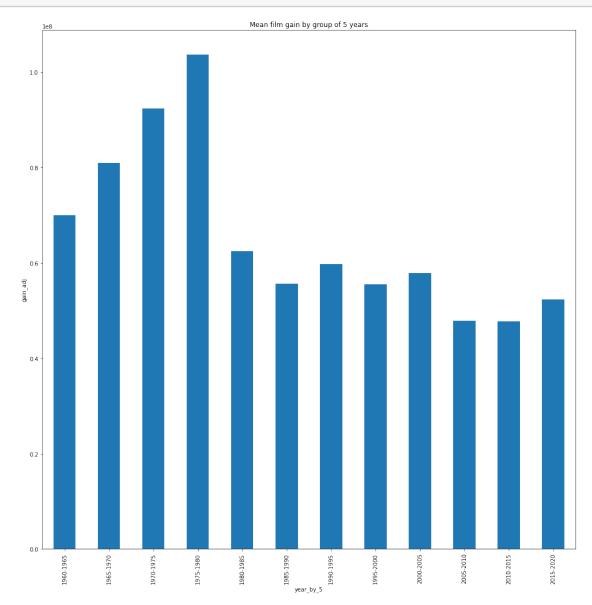

What if we group release_year by 5 years?? Let's see what happens.

Research Question 5 What is the mean film gain over the years grouped by 5 years?

```
[45]: df.groupby('year_by_5').mean()['gain_adj'].plot(kind='bar', figsize=(17, 17), title='Mean film gain by⊔

→group of 5 years',
```

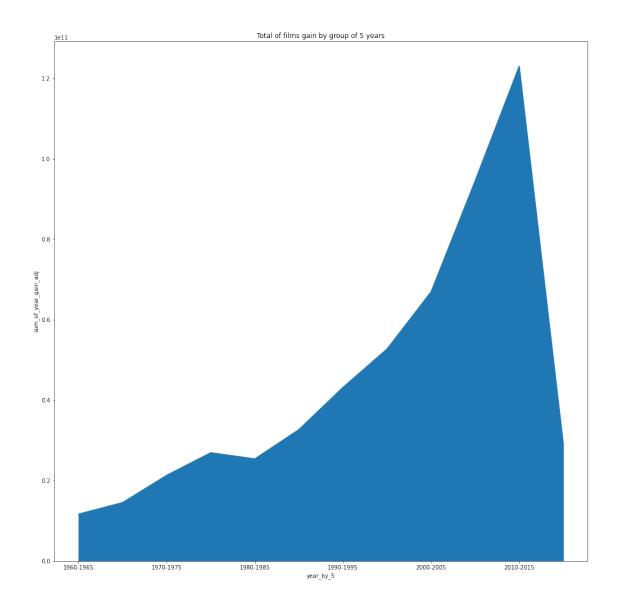

The most successfull years are the 1975 - 1980

Research Question 6 What is the total year film gain over the years by group of 5 years?

```
[46]: df.groupby('year_by_5').sum()['gain_adj'].plot(kind='area', figsize=(17, 17), title='Total of films gain by

Group of 5 years', ylabel='sum_of_year_gain_adj');
```

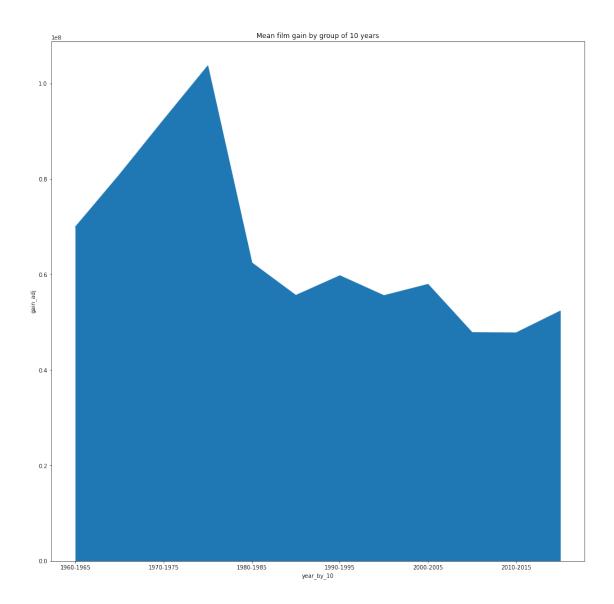

There is a greatly increasing gain in films over the years.

What if we group release_year by 10 years?? Let's see what happens.

Research Question 7 What is the mean film gain over the years grouped by 10 years?

```
[47]: df.groupby('year_by_10').mean()['gain_adj'].plot(kind='area', figsize=(17, 17), title='Mean film gain by

→group of 10 years', ylabel='gain_adj');
```

The mean film gain is around 0.5 * 1e8 \$ overall time

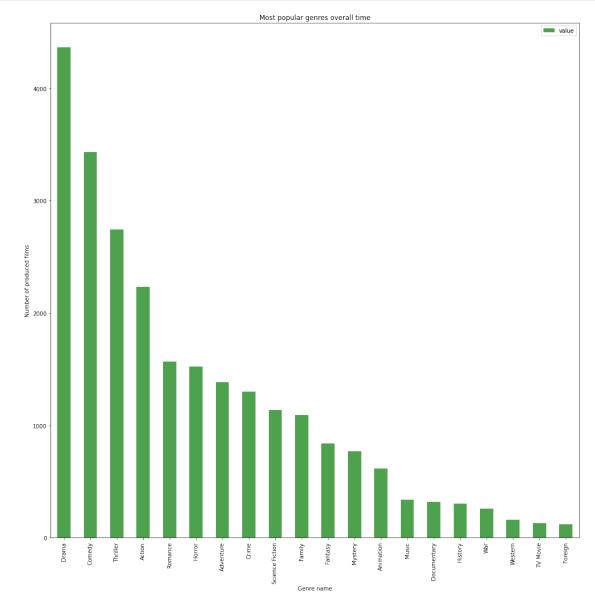

Research Question 8 What is the best principal film genre overall time?

Let's get the dataframe of all film genre produced overall time

```
[48]: df_genres = extract(df['genres'])
#df_genres
```

Now that we've the pd.DataFrame, let's plot the barchart of the 50 most popular genres according to their number of production overall time.

```
xlabel='Genre name',
ylabel='Number of produced films',
alpha=0.8,
color='forestgreen');
```

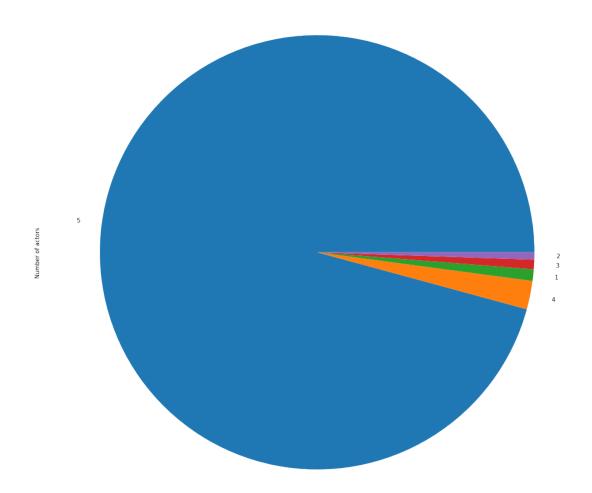

The most popular genre overall time is Drama followed by Comedy, Thriller and Action. ### Research Question 9 What is the cast number for films overall time?

```
[50]: df['cast_num'].value_counts().plot(kind='pie',
figsize=(17, 17),
title='Number of films by number of cast',
```

ylabel='Number of actors');

Number of films by number of cast

Looks like overall time, films used to have 5 principal actors in thier cast.

Research Question 10 What is the mean runtime evolution over the years ?

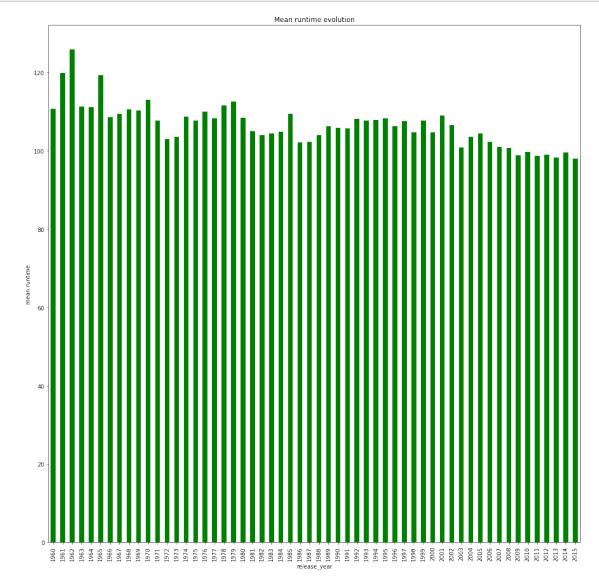

```
[51]: df.groupby('release_year').mean()['runtime'].describe()
```

```
[51]: count 56.000000
mean 106.597338
std 5.403113
min 98.013053
25% 103.402211
50% 106.427703
```

75% 109.097091 max 125.833333

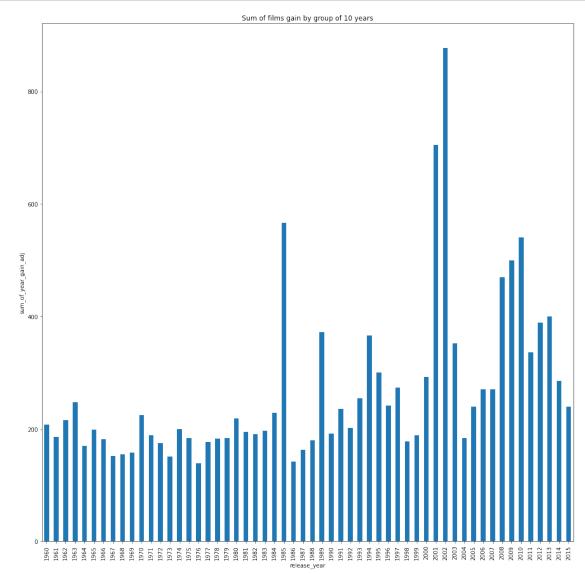

Name: runtime, dtype: float64

The mean film runtime overall time is 106 min and film runtime is between 103 min and 109 min. Let's show our results.

Research Question 11 What is the runtime of biggest films over the years?

```
[53]: df.groupby('release_year')['runtime'].max().plot(kind='bar',
figsize=(17, 17),
title='Sum of films gain by
Group of 10 years',
Gylabel='sum_of_year_gain_adj');
```

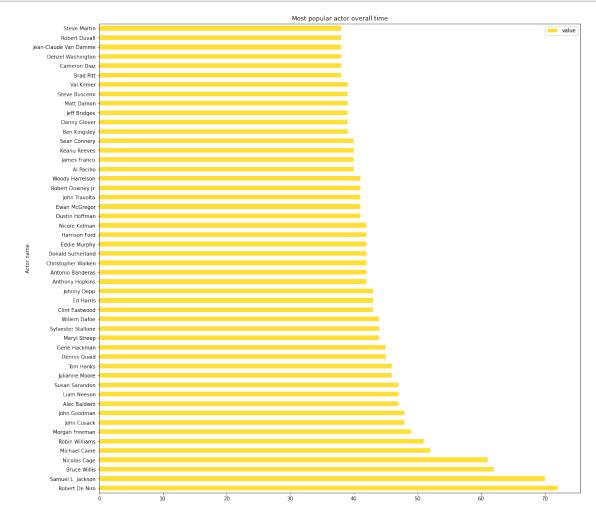

Yeah, it is confusing and unbelievable, but I double checked the dataset, and there is no error from me though. We can conclude that there are some unrealistic values within our dataset in the runtime column, regarding the maximum film runtime over the years.

Research Question 12 What is the most popular actor overall time?

Let's get the dataframe of all the actors who ever casted in a movie overall time

```
[54]: df_actors = extract(df['cast']) #df_actors
```

Now that we've the pd.DataFrame, let's plot the barchart of the 50 most popular actors according to their number of appearances overall time.

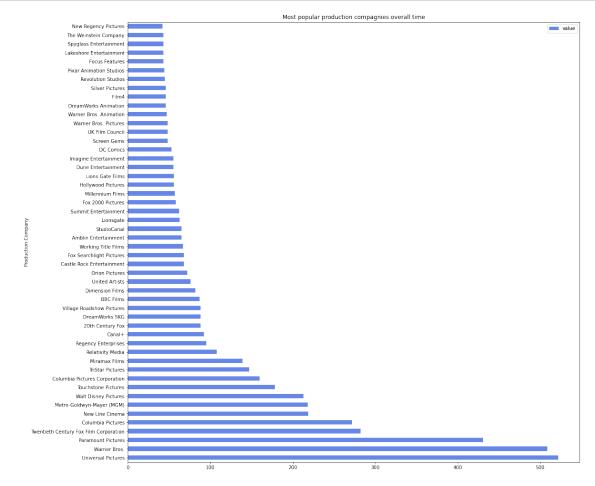

The most popular actor overall time is Robert De Niro followed by Samuel L. Jackson.

Research Question 13 What is the biggest production company (by number of produced films) overall time?

Let's get the dataframe of all the production compagnies overall time

```
[56]: df_prod_comp = extract(df['production_companies'])
#df_prod_comp
```

Now that we've the pd.DataFrame, let's plot the barchart of the 50 most popular production compagnies according to their number of produced films overall time.

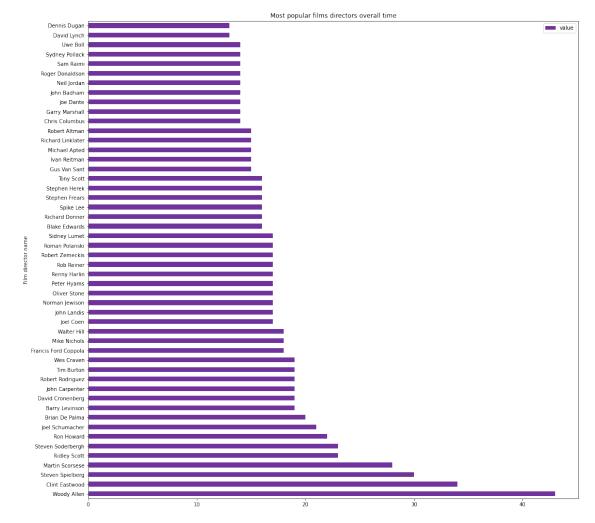

The most popular production company overall time is Universal Pictures followed by Warner Bros. and Paramount Pictures.

Research Question 14 Films directors by number of directed films overall time?

Let's get the dataframe of all the films directors overall time

```
[58]: df_director = extract(df['director'])
```

Now that we've the pd.DataFrame, let's plot the barchart of the 50 most popular films directors according to their number of directed films overall time.

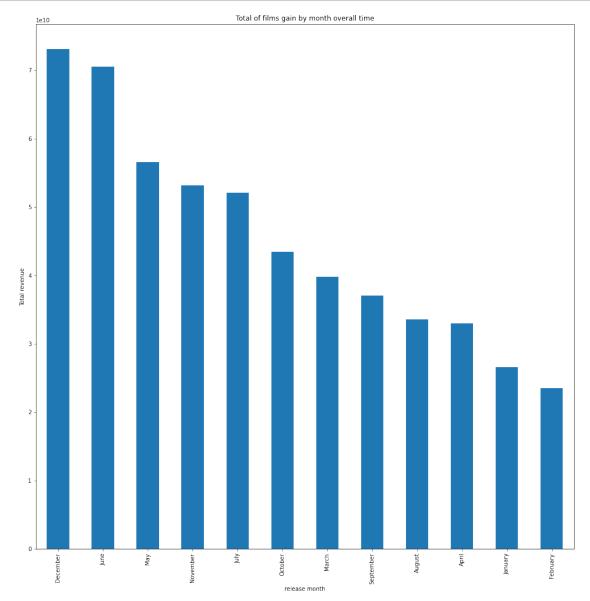

The most film's director overall time is Woody Allen followed by Clint Eastwood and Steven Spielberg.

Research Question 15 Month associated with high revenue overall time?

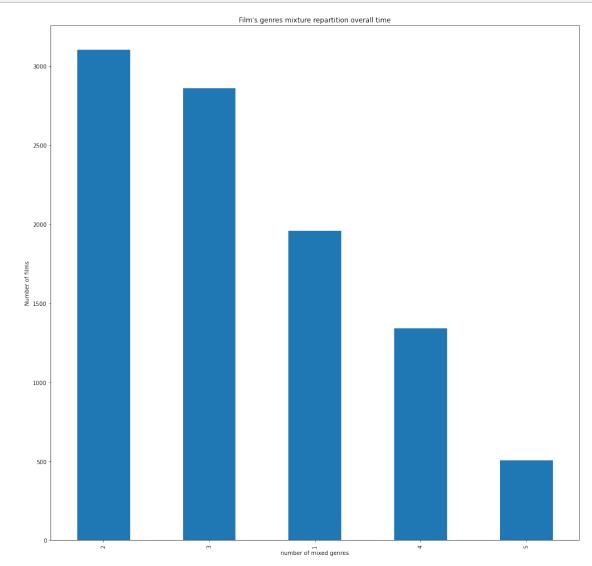

```
[60]: df.groupby('release_month_name').sum()['gain_adj'].nlargest(12).plot(kind='bar', figsize=(17, 17), title='Total of films gain by

→month overall time', xlabel='release month', ylabel='Total revenue');
```

It look's like the best months to release a movie are: 1. December 2. June 3. May 4. November 5. July

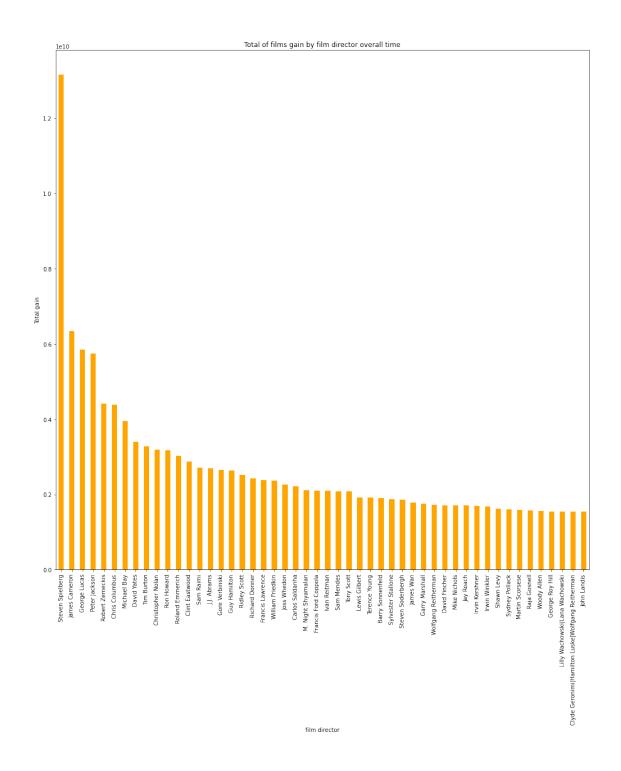

Research Question 16 Film's genres mixture repartition overall time?

Most films mix about 2 or 3 differents genres.

Research Question 17 Films directors with total film gain overall time? Let's plot the barchart of 50 films directors by total gain of their directed films overall time

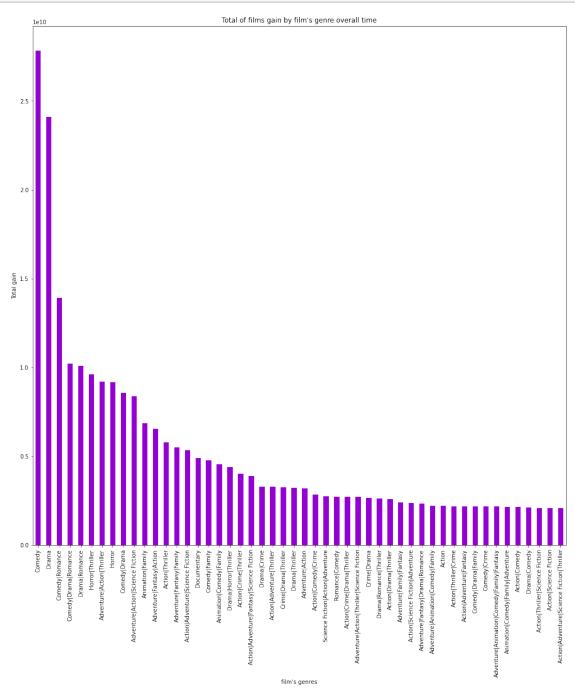

```
[62]: df.groupby('director').sum()['gain_adj'].nlargest(50).plot(kind='bar', figsize=(17, 17), title='Total of films gain by of title='Total of films gain by of title='film director', ylabel='Total gain', color='orange');
```

The most successful film director overall time is Steven Spielberg followed by James Cameron and George Lucas.

Research Question 18 Film's genres with total gain overall time ?

Let's plot the barchart of 50 film's genres by total gain of their produced films overall time

The most successful film's genre is Comedy followed by Drama, Comedy|Romance and Comedy|Drama|Romance.

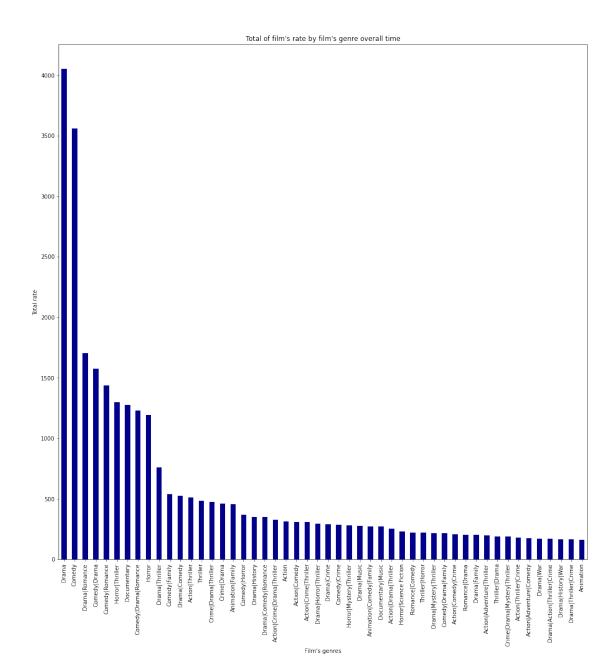

Research Question 19 The most rated film's genre overall time?

Let's plot the barchart of 50 most rated film's genres by total rate of their produced films overall time

```
[64]: df.groupby('genres').sum()['vote_average'].nlargest(50).plot(kind='bar', figsize=(17, 17), title="Total of film's rate by⊔

→film's genre overall time",

xlabel="Film's genres", ylabel='Total rate', color='darkblue');
```

The most rated film's genre is Drama followed by Comedy, Drama|Romance and Comedy|Drama. ### Research Question 20 What is the biggest production company (by total gain of produced films) overall time?

```
[65]: df.groupby('production_companies').sum()['gain_adj'].nlargest(50).

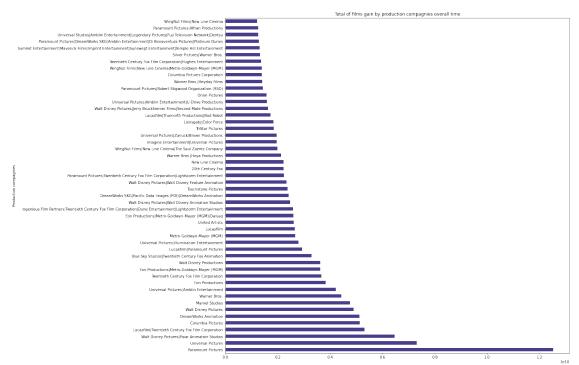

□plot(kind='barh',

figsize=(17, 17),

title="Total of films gain by

□production compagnies overall time",
```

```
xlabel="Production compagnies",
ylabel='Total gain',
color='darkslateblue');
```

The most successfull production company overall time is Paramount Pictures followed by Universal Pictures.

Conclusions

Tip: Finally, summarize your findings and the results that have been performed in relation to the question(s) provided at the beginning of the analysis. Summarize the results accurately, and point out where additional research can be done or where additional information could be useful.

Tip: Make sure that you are clear with regards to the limitations of your exploration. You should have at least 1 limitation explained clearly.

Tip: If you haven't done any statistical tests, do not imply any statistical conclusions. And make sure you avoid implying causation from correlation!

Tip: Once you are satisfied with your work here, check over your report to make sure that it is satisfies all the areas of the rubric (found on the project submission page at the end of the lesson). You should also probably remove all of the "Tips" like this one so that the presentation is as polished as possible.

• there has been an increasing films budgets in the early 2000's

- There were great revenues in 1967 and 1977. But the revenues are stable and greatly high overall time.
- We can surely say that the film industry is a paying industry. The minimum mean gain overall time is around 40 000 000 \$.
- We can say that the total year film gain evolution over the years is greatly increasing. Year 2014 is the year of biggest gain overall time, and year 2015 comes closer.
- The most successfull years are the 1975 1980
- There is a greatly increasing gain in films over the years.
- The mean film gain is around 0.5 * 1e8 \$ overall time
- The most popular genre overall time is Drama followed by Comedy, Thriller and Action.
- Looks like overall time, films used to have 5 principal actors in thier cast.
- The mean film runtime overall time is 106 min and film runtime is between 103 min and 109 min.
- There are some unrealistic values within our dataset in the **runtime** column, regarding the maximum film runtime over the years.
- The most popular actor overall time is Robert De Niro followed by Samuel L. Jackson.
- The most popular production company overall time is Universal Pictures followed by Warner Bros. and Paramount Pictures.
- The most film's director overall time is Woody Allen followed by Clint Eastwood and Steven Spielberg.
- The best months to release a movie are December and June
- Most films mix about 2 or 3 differents genres.
- The most successful film director overall time is Steven Spielberg followed by James Cameron and George Lucas.
- The most successful film's genre is Comedy followed by Drama, Comedy|Romance and Comedy|Drama|Romance.
- The most rated film's genre is Drama followed by Comedy, Drama | Romance and Comedy | Drama.
- The most successfull production company overall time is Paramount Pictures followed by Universal Pictures.

Limitations ecountered:

- There are multiple rows with crucial missing values that led to removal, leading to information loss
- We choosed to fill the zeros values by the corresponding mean to avoid information loss

Submitting your Project

Tip: Before you submit your project, you need to create a .html or .pdf version of this notebook in the workspace here. To do that, run the code cell below. If it worked

correctly, you should get a return code of 0, and you should see the generated .html file in the workspace directory (click on the orange Jupyter icon in the upper left).

Tip: Alternatively, you can download this report as .html via the **File** > **Download** as submenu, and then manually upload it into the workspace directory by clicking on the orange Jupyter icon in the upper left, then using the Upload button.

Tip: Once you've done this, you can submit your project by clicking on the "Submit Project" button in the lower right here. This will create and submit a zip file with this .ipynb doc and the .html or .pdf version you created. Congratulations!

```
[]: #!pip install keyboard
import keyboard
keyboard.press_and_release('ctrl+s+Enter')
```

Let's export to html and pdf

```
[]: from subprocess import call call(['python', '-m', 'nbconvert', 'Investigate_a_Dataset.ipynb', '--to', □ → 'pdf'])
```

```
[]: from subprocess import call call(['python', '-m', 'nbconvert', 'Investigate_a_Dataset.ipynb', '--to', □ → 'html'])
```

```
[]: #!pip install keyboard
import keyboard
keyboard.press_and_release('ctrl+s+Enter')
```

[]:
