Investigate_a_Dataset

August 3, 2022

> **Tip**: Welcome to the Investigate a Dataset project! You will find tips in quoted sections like this to help organize your approach to your investigation. Once you complete this project, remove these **Tip** sections from your report before submission. First things first, you might want to double-click this Markdown cell and change the title so that it reflects your dataset and investigation.

1 Project: Investigate a Dataset - TMDb movie data

This data set contains information about 10,000 movies collected from The Movie Database (TMDb), including user ratings and revenue.

Certain columns, like 'cast' and 'genres', contain multiple values separated by pipe (|) characters. There are some odd characters in the 'cast' column. Don't worry about cleaning them. You can leave them as is. The final two columns ending with "_adj" show the budget and revenue of the associated movie in terms of 2010 dollars, accounting for inflation over time. ## Table of Contents

Introduction

Data Wrangling

Exploratory Data Analysis

Conclusions

Introduction

1.0.1 Dataset Description

> **Tip**: In this section of the report, provide a brief introduction to the dataset you've selected/downloaded for analysis. Read through the description available on the homepage-links present here. List all column names in each table, and their significance. In case of multiple tables, describe the relationship between tables.

The Movie Database (TMDB) is a community built movie and TV database. Every piece of data has been added by our amazing community dating back to 2008. TMDb's strong international focus and breadth of data is largely unmatched and something we're incredibly proud of. Put simply, we live and breathe community and that's precisely what makes us different.

The TMDB Advantage

- 1 Every year since 2008, the number of contributions to our database has increased. With over 400,000 developers and companies using our platform, TMDB has become a premiere source for metadata.

- 2 Along with extensive metadata for movies, TV shows and people, we also offer one of the best selections of high resolution posters and fanart. On average, over 1,000 images are added every single day.

- 3 We're international. While we officially support 39 languages we also have extensive regional data. Every single day TMDB is used in over 180 countries.

- 4 Our community is second to none. Between our staff and community moderators, we're always here to help. We're passionate about making sure your experience on TMDB is nothing short of amazing.

- 5 Trusted platform. Every single day our service is used by millions of people while we process over 3 billion requests. We've proven for years that this is a service that can be trusted and relied on.

source

1.0.2 Question(s) for Analysis

Tip: Clearly state one or more questions that you plan on exploring over the course of the report. You will address these questions in the **data analysis** and **conclusion** sections. Try to build your report around the analysis of at least one dependent variable and three independent variables. If you're not sure what questions to ask, then make sure you familiarize yourself with the dataset, its variables and the dataset context for ideas of what to explore.

Tip: Once you start coding, use NumPy arrays, Pandas Series, and DataFrames where appropriate rather than Python lists and dictionaries. Also, **use good coding practices**, such as, define and use functions to avoid repetitive code. Use appropriate comments within the code cells, explanation in the mark-down cells, and meaningful variable names.

1) Which genres are most popular from year to year?
2) What kinds of properties are associated with movies that have high revenues?
3)

[ ]:

```
[1]: # Use this cell to set up import statements for all of the packages that you
     #   plan to use.
     # Remember to include a 'magic word' so that your visualizations are plotted
     #   inline with the notebook. See this page for more:
     #   http://ipython.readthedocs.io/en/stable/interactive/magics.html
     # loading packages
     import numpy as np
     import pandas as pd
     import seaborn as sns
     import matplotlib.pyplot as plt
     %matplotlib inline
```

```
[2]:  # Upgrade pandas to use dataframe.explode() function.
      # !pip install --upgrade pandas==0.25.0
```

Data Wrangling

Tip: In this section of the report, you will load in the data, check for cleanliness, and then trim and clean your dataset for analysis. Make sure that you **document your data cleaning steps in mark-down cells precisely and justify your cleaning decisions.**

1.0.3 General Properties

Tip: You should *not* perform too many operations in each cell. Create cells freely to explore your data. One option that you can take with this project is to do a lot of explorations in an initial notebook. These don't have to be organized, but make sure you use enough comments to understand the purpose of each code cell. Then, after you're done with your analysis, create a duplicate notebook where you will trim the excess and organize your steps so that you have a flowing, cohesive report.

```
[3]:  # Load your data and print out a few lines. Perform operations to inspect data
      #   types and look for instances of missing or possibly errant data.
      df = pd.read_csv('./Database_TMDb_movie_data/tmdb-movies.csv')
```

1.0.4 Printing DataFrame's data type and dimensions

```
[4]:  df.shape
```

```
[4]:  (10866, 21)
```

The TMdb dataset contains 10866 rows and 21 columns.

```
[5]:  df.info()
```

```
<class 'pandas.core.frame.DataFrame'>
RangeIndex: 10866 entries, 0 to 10865
Data columns (total 21 columns):
 #   Column          Non-Null Count  Dtype
---  ------          --------------  -----
 0   id              10866 non-null  int64
 1   imdb_id         10856 non-null  object
 2   popularity      10866 non-null  float64
 3   budget          10866 non-null  int64
 4   revenue         10866 non-null  int64
 5   original_title  10866 non-null  object
 6   cast            10790 non-null  object
 7   homepage        2936 non-null   object
 8   director        10822 non-null  object
 9   tagline         8042 non-null   object
 10  keywords        9373 non-null   object
```

```
11   overview              10862 non-null   object
12   runtime               10866 non-null   int64
13   genres                10843 non-null   object
14   production_companies  9836 non-null    object
15   release_date          10866 non-null   object
16   vote_count            10866 non-null   int64
17   vote_average          10866 non-null   float64
18   release_year          10866 non-null   int64
19   budget_adj            10866 non-null   float64
20   revenue_adj           10866 non-null   float64
dtypes: float64(4), int64(6), object(11)
memory usage: 1.7+ MB
```

As we can see there are missing values in some columns of our dataset. We'll handle them shortly.

1.0.5 Printing DataFrame's head

```
[6]: df.head(5)
```

```
[6]:        id    imdb_id   popularity      budget      revenue   \
     0  135397  tt0369610   32.985763   150000000   1513528810

[5 rows x 21 columns]
```

Here is presented the first 5 rows of the TMdb dataset, lets dive in.

The are Id and imdb_id columns corresponding to each film.

The film runtime runtime

The is popularity of the film

The film budget budget_adj and the film revenue revenue_adj adjusted to the inflation over time

The genres of the movie, the production_compagnies the release_date, the audience votes vote_count and the average vote vote_average.

1.0.6 Data Cleaning

Tip: Make sure that you keep your reader informed on the steps that you are taking in your investigation. Follow every code cell, or every set of related code cells, with a markdown cell to describe to the reader what was found in the preceding cell(s). Try to make it so that the reader can then understand what they will be seeing in the following cell(s).

In this part there are columns that are not valuable for our analysis such as `id`, `imdb_id`, `homepage`, `tagline`,`keywords`, `overview`, `budget`and `revenue`.

We'll also identify and count rows with crucial missing values such as `revenue_adj`, `budget_adj`, `cast` and `genres`. Even though we could fill numeric columns with the `mean()`, how can we deal with missing `cast` or missing `genres` ? We can't predict or fill them.

For the numeric values we will count and if there are minor we'll drop all of them. Otherwise We'll fill them with the `mean()`.

```
[7]: # After discussing the structure of the data and any problems that need to be
     #  cleaned, perform those cleaning steps in the second part of this section.
```

```
[8]: df.drop(['id', 'imdb_id', 'homepage', 'tagline','keywords', 'overview',␣
     ↪'budget', 'revenue'],
             axis=1,
             inplace=True)
```

Let's print the head of the new DataFrame.

```
[9]: df.head()
```

```
[9]:    popularity              original_title  \
     0   32.985763                Jurassic World
     1   28.419936            Mad Max: Fury Road
     2   13.112507                     Insurgent
     3   11.173104  Star Wars: The Force Awakens

      25%    0.000000e+00  0.000000e+00
      50%    0.000000e+00  0.000000e+00
      75%    2.085325e+07  3.369710e+07
      max    4.250000e+08  2.827124e+09
```

As we can see, there are problems with some rows like `runtime`, `budget_adj`, `revenue_adj` where most values are missing or are `Zeros`. We'll count them all.

Let's look after all columns with at least one `NaN` value

```
[11]: col_with_nan_value = [col for col in df.columns if (df[col].isnull()).any() ]
      col_with_nan_value
```

```
[11]:  ['cast', 'director', 'genres', 'production_companies']
```

Let's look after all columns with at least one `Zeros` value

```
[12]:  col_with_zeros_value = [col for col in df.columns if (df[col]==0).any() ]
       col_with_zeros_value
```

```
[12]:  ['runtime', 'budget_adj', 'revenue_adj']
```

Let's count the `Zeros` values in `runtime`, `budget_adj`, `revenue_adj` columns.

```
[13]:  (df['revenue_adj']==0).sum()
```

```
[13]:  6016
```

There are 6016 `Zeros` values in the `revenue_adj` column. How Huge they are.

```
[14]:  (df['budget_adj']==0).sum()
```

```
[14]:  5696
```

There are 5696 `Zeros` values in the `budget_adj` column. How Huge they are.

```
[15]:  (df['runtime']==0).sum()
```

```
[15]:  31
```

There are 31 `Zeros` values in the `runtime` column.

We can't drop them, the number is so important.

We'll fill the zeros values per colum with the mean. Let's proceed.

Let's calculate and fill the zeros by the mean.

```
[16]:  mean = {col: df[col].mean() for col in col_with_zeros_value}
       #print(mean)
       fill = [df[col].replace(to_replace=0, value=mean[col], inplace=True) for col in
       ↪mean.keys()]
```

```
[17]:  # Deleting unnecessary variables
       del col_with_nan_value, col_with_zeros_value, mean, fill
```

Let's look after the number of missing(`NaN`) values in our dataset

```
[18]:  df.isnull().any(axis=1).sum()
```

```
[18]:  1093
```

```
[19]:  100 * df.isnull().any(axis=1).sum() / df.shape[0]
```

```
[19]: 10.058899318976625
```

There are 1095 rows with at least one missing value, representing 10.07% of our dataset.

```
[20]: 100 * (df.shape[0] - df.isnull().any(axis=1).sum()) / df.shape[0]
```

```
[20]: 89.94110068102337
```

The correct values of our dataset represent 89.92% of it. Though we have 10866 rows, we can drop all of the incorrect values.

```
[21]: df.dropna(inplace=True)
```

Let's look about duplicates in our dataset.

```
[22]: df.duplicated().sum()
```

```
[22]: 1
```

There is one duplicate in our dataset. We'll drop it.

```
[23]: df.drop_duplicates(inplace=True)
```

Now that we have cleaned our dataset, let's describe it again.

```
[24]: df.describe()
```

```
[24]:        popularity      runtime    vote_count  vote_average  release_year  \

For further analysis, we will add new columns in our dataframe. - `gain_adj` the gain value (`revenue_adj - budget_adj`) for each film - `release_month` the month value of the release date - `release_month_name` the month name of the release date - `genre_01` for the first genre of the film - `genre_02` for the second genre of the film - `genre_03` for the third genre of the film - `director_01` for the first director of the film - `director_02` for the co-director of the film - `prod_comp_01` for the first production company of the film. - `prod_comp_02` for the second production company of the film. - `cast_num` the number of cast members of the film - `actor_01` the first actor of the film - `actor_02` the second actor of the film - `actor_03` the third actor of the film - `actor_04` the fourth actor of the film - `year_by_5` group years by 5 of length. Ex: 1965[included]-1970[excluded], 1970[included]-1975[excluded] and so on - `year_by_10` group years by 10 of length.

Ex: 1965[included]-1975[excluded], 1975[included]-1985[excluded] and so on

The list of all actors who appeared in a film and the number of their appearance overall time.

We'll define a function `extract()` to extract elements from a `pd.Series` in rows that contain |
and return a `pd.DataFrame` of all elements with their occurences

Steps: 1) We extract elements from the `pd.Series` object with the help of the function
`pd.Series.apply(lambda val: val.split("|"))` 2) We create a list of all these elements 3)
Now we'll create a `dict` object to count every element occurrence with the help of this source and
we will sort to firstly have the most popular element, with the help of this source 4) After that
we'll convert our `dict` objet to `pd.DataFrame` object with the help of this source

```python
[52]: def extract(serie: pd.Series)-> pd.DataFrame:
          group_set = []
          for element in serie.apply(lambda val: val.split("|")) :
              #print(element)
              for subelt in element:
                  #print(subelt)
                  group_set.append(f'{subelt.strip()}')

          # Now we create an array of items
          group_set = np.array(group_set)

          # We create a dict object key: actor, value: number of appearances
          # Now we count every actor apparition in the `group_set`
          # variable with np.count_nonzero() and np.unique()
          dict_elts = {actor: np.count_nonzero(group_set == actor) for actor in np.
       ↪unique(group_set)}

          # We sort the dict with the most popular actor first (according
          # to the maximum number of appearances)
```

```
    dict_elts = dict(sorted(dict_elts.items(), key=lambda item: item[1],␣
↪reverse=True))

    # After that we'll convert our `dict` objet to `pd.DataFrame` object
    df_elts = pd.DataFrame.from_dict(data=dict_elts, orient='index',␣
↪columns=['value'])

    # We return the pd.DataFrame object
    return df_elts
```

Exploratory Data Analysis

Tip: Now that you've trimmed and cleaned your data, you're ready to move on to exploration. **Compute statistics** and **create visualizations** with the goal of addressing the research questions that you posed in the Introduction section. You should compute the relevant statistics throughout the analysis when an inference is made about the data. Note that at least two or more kinds of plots should be created as part of the exploration, and you must compare and show trends in the varied visualizations.

Tip: - Investigate the stated question(s) from multiple angles. It is recommended that you be systematic with your approach. Look at one variable at a time, and then follow it up by looking at relationships between variables. You should explore at least three variables in relation to the primary question. This can be an exploratory relationship between three variables of interest, or looking at how two independent variables relate to a single dependent variable of interest. Lastly, you should perform both single-variable (1d) and multiple-variable (2d) explorations.

1.0.8 Research Question 1: What is the mean film budget over the years?

For that we will group our dataset by years and get the mean film budget for each year and plot.

```
[53]: df.groupby('release_year').mean()['budget_adj'].plot(kind='bar',
                                                          figsize=(17, 17),
                                                          title='Mean film budget by␣
↪year',
                                                          ylabel='budget_adj');
```

16

Mean film budget by year
As we can see, there has been an increasing films budgets in the early 2000's, why? Perhaps beacause of the vulgarisation of the films distribution means, Internet apparition, devices, communication possibilities, and so on...

1.0.9 Research Question 2 What is the mean film revenue over the years?

```
[54]: df.groupby('release_year').mean()['revenue_adj'].plot(kind='bar',
                                                            figsize=(17, 17),
                                                            title='Mean film revenue␣
      ↪by year',

                                                            ylabel='revenue_adj');
```
### 1.0.10 Research Question 3 What is the mean film gain over the years?

```
[55]: df.groupby('release_year').mean()['gain_adj'].plot(kind='bar',
                                                          figsize=(17, 17),
                                                          title='Mean film gain by␣
      ↪year',

                                                          ylabel='gain_adj');
```

Mean film gain by year
```
[56]: df.groupby('release_year').mean()['gain_adj'].min()
```

```
[56]: 36913300.504791535
```

We can surely say that the film industry is rent. the minimum mean gain overall time is around 40 000 000 $.

1.0.11 Research Question 4 What is the total year film gain over the years?

```
[57]: df.groupby('release_year').sum()['gain_adj'].plot(kind='bar',
                                                        figsize=(17, 17),
                                                        title='Sum of films gain by␣
       ↪year',
```

```
                                                           ␣
  ↪ylabel='sum_of_year_gain_adj');
```

Sum of films gain by year
We can say that the total year film gain evolution over the years is greatly increasing. Year 2014 is the year of biggest gain overall time, and year 2015 comes closer.

What if we group `release_year` by 5 years?? Let's see what happens.

1.0.12 Research Question 5 What is the mean film gain over the years grouped by 5 years?

```
[58]: df.groupby('year_by_5').mean()['gain_adj'].plot(kind='bar',
                                                figsize=(17, 17),
                                                title='Mean film gain by
      ↪group of 5 years',
                                                ylabel='gain_adj');
```
1.0.13 Research Question 6 What is the total year film gain over the years by group of 5 years?

```
[59]: df.groupby('year_by_5').sum()['gain_adj'].plot(kind='bar',
                                                  figsize=(17, 17),
                                                  title='Total of films gain by␣
      ↪group of 5 years',
                                                  ylabel='sum_of_year_gain_adj');
```

What if we group `release_year` by 10 years?? Let's see what happens.

1.0.14 Research Question 7 What is the mean film gain over the years grouped by 10 years?

```
[60]: df.groupby('year_by_10').mean()['gain_adj'].plot(kind='bar',
                                                figsize=(17, 17),
                                                title='Mean film gain by␣
      ↪group of 10 years',

                                                ylabel='gain_adj');
```

1.0.15 Research Question 8 What is the best principal film genre overall time ?

Let's get the dataframe of all film genre produced overall time

23

```
[61]: df_genres = extract(df['genres'])
      #df_genres
```

Now that we've the `pd.DataFrame`, let's plot the barchart of the 50 most popular genres according to their number of production overall time.

```
[62]: df_genres.iloc[:50].plot(kind='barh',
                               figsize=(17, 17),
                               title='Most popular genres overall time',
                               xlabel='Genre name',
                               ylabel='Number of produced films',
                               alpha=0.8,
                               color='forestgreen');
```

The most popular genre overall time is `Drama` followed by `Comedy`, `Thriller` and `Action`.

1.0.16   Research Question 9 What is the cast number for films overall time?

```
[63]: df['cast_num'].value_counts().plot(kind='bar',
                                          figsize=(17, 17),
                                          title='Number of films by number of cast',
                                          xlabel='Number fo actors',
                                          ylabel='number of films',
                                          alpha=0.5,
                                          color='green');
```

Looks like overall time, films used to have 5 principal actors in thier cast.

1.0.17 Research Question 10 What is the mean runtime evolution over the years ?

```
[64]: df.groupby('release_year').mean()['runtime'].describe()
```

```
[64]: count      56.000000
      mean      106.597338
      std         5.403113
      min        98.013053
      25%       103.402211
      50%       106.427703
      75%       109.097091
      max       125.833333
      Name: runtime, dtype: float64
```

The mean film runtime overall time is 106 min and film runtime is between 103 min and 109 min.

Let's show our results.

```
[65]: df.groupby('release_year').mean()['runtime'].plot(kind='bar',
                                                        figsize=(17, 17),
                                                        title='Mean runtime␣
      ↪evolution',
                                                        ylabel='mean runtime',
                                                        color = 'green');
```

Mean runtime evolution
1.0.18 Research Question 11 What is the runtime of biggest films over the years?

```
[66]: df.groupby('release_year')['runtime'].max().plot(kind='bar',
                                                figsize=(17, 17),
                                                title='Sum of films gain by␣
      ↪group of 10 years',
                                                                      ␣
      ↪ylabel='sum_of_year_gain_adj');
```

Sum of films gain by group of 10 years
Yeah, it is confusing and unbelievable, but I double checked the dataset, and there is no error from me though. We can conclude that there are some unrealistic values within our dataset in the `runtime` column, regarding the maximum film runtime over the years.

1.0.19 Research Question 12 What is the most popular actor overall time ?

Let's get the dataframe of all the actors who ever casted in a movie overall time

```
[67]: df_actors = extract(df['cast'])
      #df_actors
```

Now that we've the `pd.DataFrame`, let's plot the barchart of the 50 most popular actors according to their number of appearances overall time.

```
[68]: df_actors.iloc[:50].plot(kind='barh',
                                figsize=(17, 17),
                                title='Most popular actor overall time',
                                xlabel='Actor name',
                                ylabel='Number of appearances',
                                alpha=0.8,
                                color='gold');
```

The most popular actor overall time is `Robert De Niro` followed by `Samuel L. Jackson`.

1.0.20 Research Question 13 What is the biggest production company overall time ?

Let's get the dataframe of all the production compagnies overall time

```
[69]: df_prod_comp = extract(df['production_companies'])
      #df_prod_comp
```

Now that we've the `pd.DataFrame`, let's plot the barchart of the 50 most popular production

compagnies according to their number of produced films overall time.

```
[70]: df_prod_comp.iloc[:50].plot(kind='barh',
                                  figsize=(17, 17),
                                  title='Most popular production compagnies␣
      ↪overall time',
                                  xlabel='Production Company',
                                  ylabel='Number of films',
                                  alpha=0.8,
                                  color='royalblue');
```

The most popular production company overall time is `Universal Pictures` followed by `Warner Bros.` and `Paramount Pictures`.
1.0.21   Research Question 14 Films directors by number of directed films overall time ?

Let's get the dataframe of all the films directors overall time

```
[71]: df_director = extract(df['director'])
```

Now that we've the `pd.DataFrame`, let's plot the barchart of the 50 most popular films directors according to their number of directed films overall time.

```
[72]: df_director.iloc[:50].plot(kind='barh',
                                 figsize=(17, 17),
                                 title='Most popular films directors overall␣
       ↪time',

                                 xlabel='Film director name',
                                 ylabel='Number of directed films',
                                 alpha=0.8,
                                 color='indigo');
```

The most film's director overall time is `Woody Allen` followed by `Clint Eastwood` and `Steven Spielberg`.

[ ]:

1.0.22 Research Question 15 Month associated with high revenue overall time ?

```python
[73]: df.groupby('release_month_name').sum()['gain_adj'].plot(kind='bar',
                                                figsize=(17, 17),
                                                title='Total of films gain by↵
       ↪month overall time',
                                                xlabel='release month',
                                                ylabel='Total revenue');
```

It look's like the best months to release a movie are : 1. December 2. June 3. May 4. November 5.

July

1.0.23 Research Question 16 Film's genres mixture repartition overall time ?

```
[74]: df['genres_num'].value_counts().plot(kind='bar',
                                            figsize=(17, 17),
                                            title="Film's genres mixture␣
      ↪repartition overall time",

                                            xlabel='number of mixed genres',
                                            ylabel='Number of films');
```

Film's genres mixture repartition overall time

[ ]:
1.0.24 Research Question 14 Films directors by number of directed films overall time ?

```
[75]: df.index[:2]
```

```
[75]: Int64Index([0, 1], dtype='int64')
```

```
[76]: for index in df.index[:2] :

```

Conclusions

Tip: Finally, summarize your findings and the results that have been performed in relation to the question(s) provided at the beginning of the analysis. Summarize the results accurately, and point out where additional research can be done or where additional information could be useful.

Tip: Make sure that you are clear with regards to the limitations of your exploration. You should have at least 1 limitation explained clearly.

Tip: If you haven't done any statistical tests, do not imply any statistical conclusions. And make sure you avoid implying causation from correlation!

Tip: Once you are satisfied with your work here, check over your report to make sure that it is satisfies all the areas of the rubric (found on the project submission page at the end of the lesson). You should also probably remove all of the "Tips" like this one so that the presentation is as polished as possible.

1.1 Submitting your Project

Tip: Before you submit your project, you need to create a .html or .pdf version of this notebook in the workspace here. To do that, run the code cell below. If it worked correctly, you should get a return code of 0, and you should see the generated .html file in the workspace directory (click on the orange Jupyter icon in the upper left).

Tip: Alternatively, you can download this report as .html via the **File** > **Download as** submenu, and then manually upload it into the workspace directory by clicking on the orange Jupyter icon in the upper left, then using the Upload button.

Tip: Once you've done this, you can submit your project by clicking on the "Submit Project" button in the lower right here. This will create and submit a zip file with this .ipynb doc and the .html or .pdf version you created. Congratulations!

```python
#!pip install keyboard
import keyboard
keyboard.press_and_release('ctrl+s+Enter')
```

Let's export to html and pdf

```python
from subprocess import call
call(['python', '-m', 'nbconvert', 'Investigate_a_Dataset.ipynb', '--to',
 'pdf'])
```

```python
from subprocess import call
call(['python', '-m', 'nbconvert', 'Investigate_a_Dataset.ipynb', '--to',
 'html'])
```

```python

```
